

HW4 Reflection

The app is made with 4 different SwiftUI Views, in a Navigation Stack. A list lets us navigate between each, switching between labs 1, 2, and the additional screen of which I chose to use the calendar. Lab C gets events, continually keeps them updated, and even lets you modify the title. I didn't take any particular measures to avoid Cyclic references. I used a few singletons to follow design patterns - I believe them to be optimal, and was able to use `ObservedObject` to keep properties in sync.
